

Key Agronomic Strategies for Integrated Alfalfa Pest Management (IPM) “Integrated Crop Management”

Dan Putnam

University of California, Davis

<http://alfalfa.ucdavis.edu>

Integrated Crop Management:

Integrated Pest Management (IPM): it's not just insects

Hierarchy of Pest Concerns in Alfalfa:

- Weeds
- Insects
- Gophers/rodents
- Nematodes
- Diseases

(importance differs by region and farm)

© D.H. Putnam

Optimizing the Plant and Environment to Prevent Pests

**Plant Defense
(Genetic Resistance)**

**Plant Nutrients
(Soil Fertility)**

**Soil Health
(Biological and Physical)**

© D.H. Putnam

Integrated Crop Management Impacts IPM

A deep truth.....

- A vigorous deep-rooted alfalfa crop is the best defense against weeds, diseases and insects

Phytophthora

Key Practices that impact IPM

- **I. Soil Prep & Fertility Management**
 - **What is limiting regrowth?**
- **II. Stand Establishment Technique**
 - **Soil Prep, Timing, Technique**
- **III. Variety Selection**
 - **High yield, Multiple Pest Resistance**
- **IV. Irrigation Management**
 - **Prevent standing water, excess moisture**
- **V. Harvest Management**
 - **Delayed Harvests strengthens roots/regrowth**
- **VI. Cropping Systems/Rotation**
 - **Key for preventing weed/disease buildup**

© D.H. Putnam

Early Steps: Stand Establishment

□ **Good Stand Establishment method:
likely THE most important IPM practice!**

1. **Planted on time**
2. **Beds allow drainage**
3. **Seeding depth**
4. **Weed control**
5. **Careful irrigation**

© D.H. Putnam

I. Soil Prep, Soil Health, Fertility:

Analysis of Major Soil Issues for short & long term

- ❑ Soil Prep & Fertility: DRAINAGE is key
- ❑ Liming/amendment needs?
- ❑ Need for deep tillage? for long-term
- ❑ Levelling? Standing water causes stand loss and root diseases.
- ❑ Long term fertility program (P,K,S)?
Micronutrients (Mn, B)? Have you tested?
- ❑ Is your soil healthy, without major limitations?

© D.H. Putnam

Soil Impediments... Can limit growth for years

© D.H. Putnam

Even on sands – layers occur

© D.H. Putnam

Ripping to moderate depths 0.5 to 0.75 meters almost always recommended

© D.H. Putnam

Soil Condition & Prep impacts pests:

- Drainage impacts soil diseases
- Deep Tillage disrupts gophers/rodents
- Oxygen, infiltration-improves root depth & health
- Land Levelling and Final tillage impacts:
 - Germination, seedling health
 - Standing water – seedling diseases

© D.H. Putnam

Leveling—Critical for Flood Irrigation

Small Problems last for years...

© D.H. Putnam

II. Stand Establishment: Skill and Technique

- ❑ **Timing – plant early fall when optimum for seedling development (late summer, intermountain)**
- ❑ **Seeding Depth, good soil-seed contact**
- ❑ **Distribution of seed (broadcast? Drill?)**
- ❑ **Early irrigation management**
- ❑ **Control of early weeds (key problem for organic)**

© D.H. Putnam

Goal:

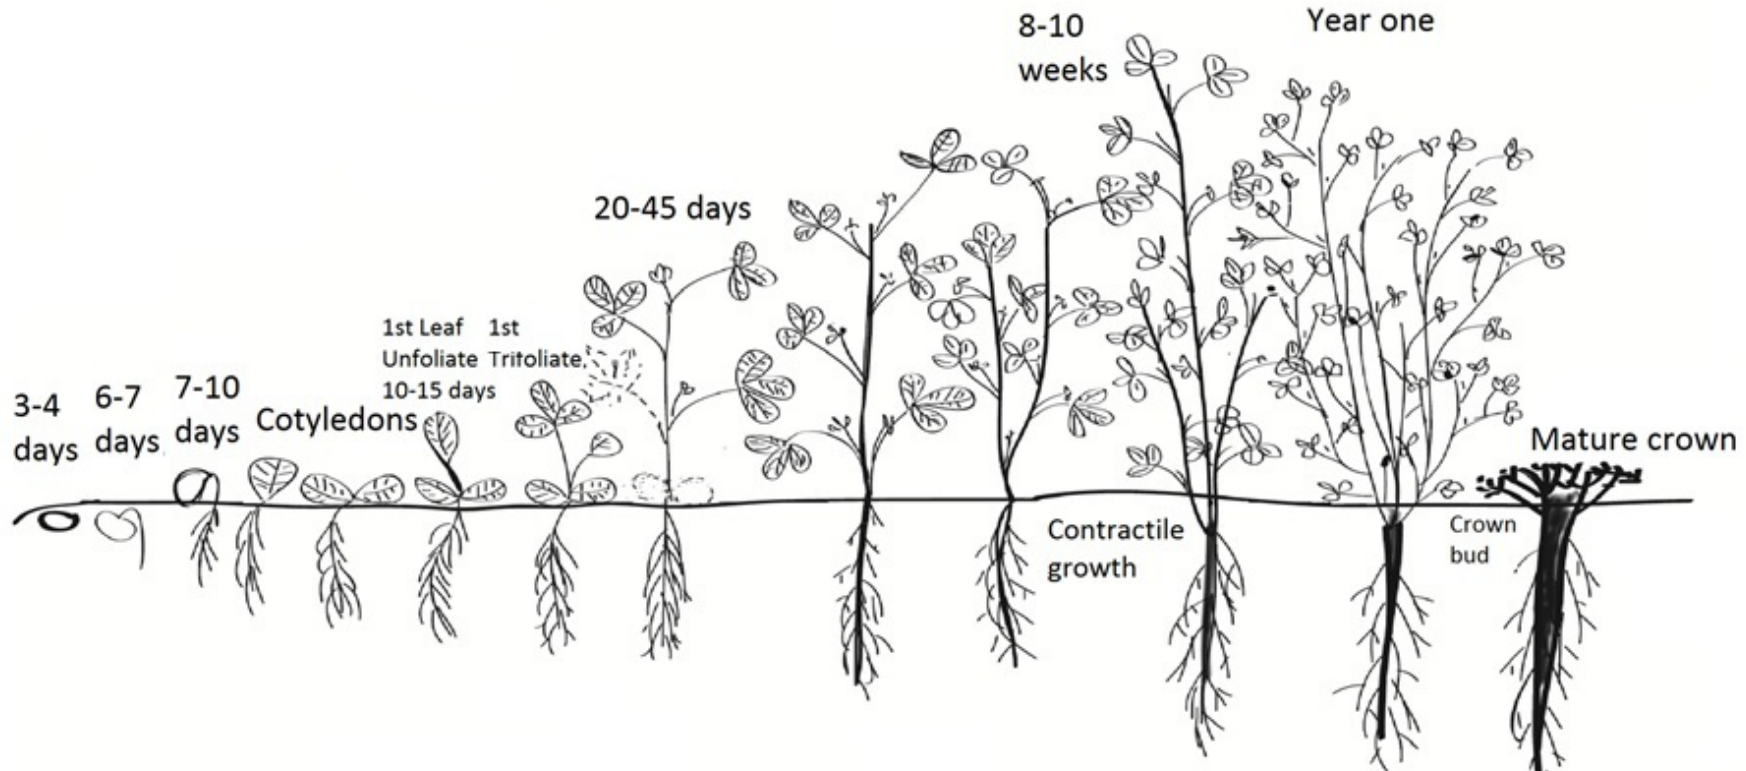

- Optimize conditions for early seedling growth (moisture, temperature, solar radiation, soil)
- Farm for the roots!
- Wait, wait on first harvest!

© D.H. Putnam

Alfalfa must be nurtured from a 'baby' to strong, deep-rooted plant

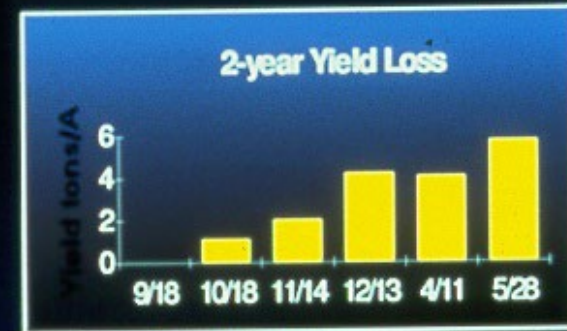

Dr. Mohammad Akmal, Illustration

Early Seeding – Very important

Effect of Planting Date on 2-Year Yields

Marble & Peterson WSFS, 1980-81

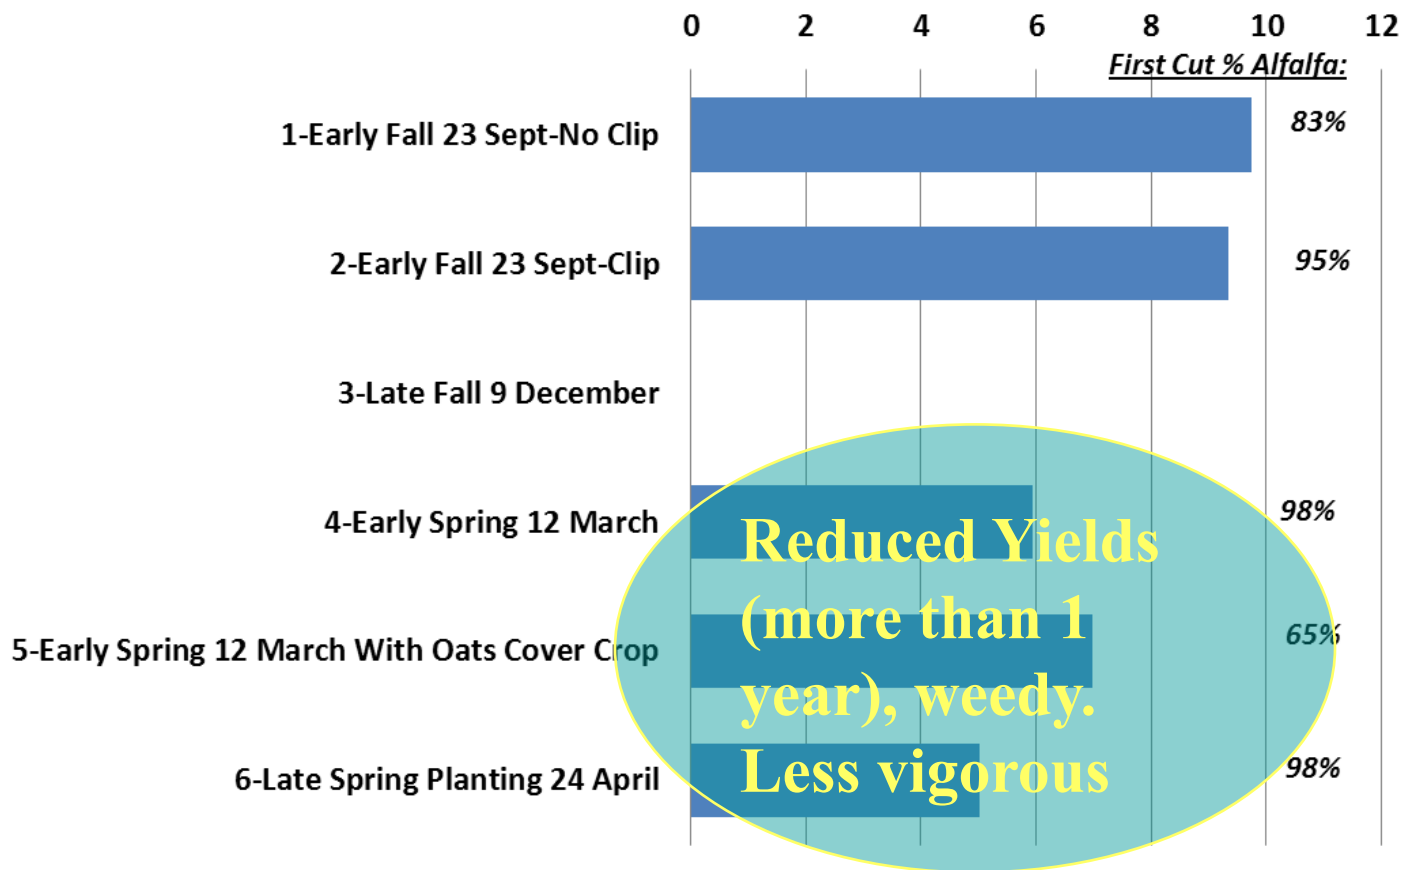

Planting Date
(missing values 10/18 1980 and total)

Influence of Planting Date on Year 1 yields (Fresno County), 2012

Influence of Planting Date on 4-cut yields- Organic Trial, Kearney Agric. Center, 2012

Planting Depth is Critical

Depth (in)	Emergence
1/4" - 1/2 "	60%
1"	48%
2-2 1/2"	2%

Great
opportunity for
weeds!

© D.H. Putnam

Prevent Standing Water during establishment

- Poorly drained Fields
- Moves water down fields – prevents standing water
- Prevents seedling diseases/stand loss

© D.H. Putnam

Early Control of Weeds is important

© D.H. Putnam

Little problems become....

© D.H. Putnam

Big Problems

© D.H. Putnam

II. Soil Fertility Management

- Test Soils for limiting nutrients
 - Key are P, K, S, sometimes micros
- Examine annual uptake levels
 - Apply for long-term
- Soil Ph, salinity need for Gypsum?
- Vigorous top growth, vigorous roots
 - Resists diseases, weeds, nematodes

© D.H. Putnam

III. Variety Choice: A Key IPM Strategy

- **Select for yield, yes, since high yielding crops are more competitive with weeds**
- **But..... There is more**

© D.H. Putnam

Alfalfa Variety Ratings 2022

Winter Survival, Fall Dormancy & Pest Resistance Ratings for Alfalfa Varieties

Alfalfa has a wider range of Pest resistances than most crops

www.alfalfa.org

© D.H. Putnam

Characteristics:	Range
Fall Dormancy (FD)	2-10
Winter Survival	1 (superior)-6 (none)
Bacterial Wilt (BW)	S to HR
Verticillium Wilt (VW)	S to HR
Fusarium Wilt (FW)	S to HR
Anthracnose Race 1 (Anth1)	S to HR
Phytophthora Root Rot (PRR)	S to HR
Spotted Alfalfa Aphid (SAA)	S to HR
Pea Aphid (PA)	S to HR
Blue Alfalfa Aphid (BAA)	S to HR
Stem Nematode (StN)	S to HR
Aphanomyces Race 1 (ANT1)	S to HR
Aphanomyces Race 2 (ANT2)	S to HR
S. Rook Knot Nematode (SRN)	S to HR
N. Root Knot Nematode (NRN)	LR to HR
Potato Leafhopper (PL)	S to HR
Mulifoliolate Expression (MF)	L to H
Continuous Grazing Tolerance (GT)	Y or N
Standability Expression (St)	MR to R
Salt Tolerance (G-Germination, F-Forage)	G or F
Technology (H-Hybrid, R-RRA)	C or H or RR

ALFALFA CONGRESS SAN DIEGO CALIFORNIA USA

Check Out the Varieties

www.nafa.org

Fall Dormancy Rating	Number of varieties	Fall Dormancy Class
2	2	V. Dormant
3	12	Dormant
4	82	Dormant
5	30	M. dormant
6	14	Semi-dormant
7	9	Semi-dormant
8	9	Non-dormant
9	16	Non-dormant
10	2	V. Non-dormant
Total	176	

Alfalfa Variety Ratings 2022

Winter Survival, Fall Dormancy & Pest Resistance Ratings for Alfalfa Varieties

WINTER SURVIVAL, FALL DORMANCY & PEST RESISTANCE RATINGS FOR ALFALFA VARIETIES

FALL DORMANCY (FD) RATING DESCRIPTIONS			
FD Rating	Description	FD Rating	Description
1	Very Dormant	6	Semi-Dormant
2	Very Dormant	7	Semi-Dormant
3	Dormant	8	Non-Dormant
4	Dormant	9	Non-Dormant
5	Moderately Dormant	10	Very Non-Dormant
		11	Very Non-Dormant

FD is the degree of fall alfalfa growth, as a response to temperature and day length. Lower dormancy ratings exhibit less fall growth, while higher dormancy ratings indicate greater fall growth. FD ratings are indices assigned by comparing the height of fall growth with standard check varieties, and tested across locations and years to accurately represent dormancy response across environments.

RESISTANCE RATINGS		
% Resistant Plants	Resistance Class	Class Abbreviations
0-5%	Susceptible	S
6-14%	Low Resistance	LR
15-30%	Moderate Resistance	MR
31-50%	Resistance	R
>50%	High Resistance	HR

WINTER SURVIVAL RATINGS		
Category	Check Variety	Score
Extremely Winterhardy	ZC 9830	1
Very Winterhardy	5262	2
Winterhardy	WL325HQ	3
Moderately Winterhardy	C-2852	4
Slightly Winterhardy	Archer	5
Non-Winterhardy	CUF 101	6

Information is obtained from the Association of Official Seed Certifying Agencies (AOSCA) and the National Alfalfa Variety Review Board (NAVRB) report. Blank spaces indicate the variety has no approved rating through AOSCA.

Agronomy Progress Reports:

These publications detail alfalfa yield trial data for single harvest, single year, and multi-year summaries for each year. Usually, both conventional and Roundup-Ready (RR) lines are tested. Yield trials are conducted in five regions in California: the Intermountain area, the Sacramento Valley, the Westside, the

UC Davis Variety Trials

UC Davis Cultivar Alfalfa Variety (planted 2019)

UC Davis Cultivar Alfalfa Variety (planted 2011)

Final Summary:

[2011 - 2014 UC Davis Cultivar multi-year summary](#)

Multi-year and Single-year Data:

Pest Resistance in Alfalfa:

HR	(Highly Resistant)	>51%
R	(Resistant)	31-50%
MR	(Moderately Resistant)	15-30%
LR	(Low Resistance)	6-14%
S	(Susceptible)	<5%

**Resistance is always a quantitative trait (% of a population)*

© D.H. Putnam

Alfalfa Disease or Insect Resistance:

Seedling Stand (80 plants/ft²)
51% Resistant (HR)

Disease Screen

Established Stand (40
plants/ft²) Highly Resistant

**Still plenty of plants to
achieve high yields and
resist pests**

© D.H. Putnam

Recommended Resistance levels:

Table 1. Recommended Fall Dormancy range and pest resistance ratings for different regions of California. Alfalfa has a greater range of genetic pest resistance characteristics than many crops.

Zone	FD	SAA	PA	BAA	PRR	BW	FW	VW	ANT	STN	RKN
Intermountain	2-4	S	R	R	R	R	HR	HR	HR	HR	R
Sacramento	4-8	MR	HR	HR	HR	MR	HR	R	R	HR	R
San Joaquin	7-9	R	HR	HR	HR	MR	HR	R	R	HR	R
Coastal	5-7	MR	HR	HR	HR	MR	HR	R	HR	HR	R
High Desert	4-8	R	R	HR	R	MR	HR	HR	HR	HR	HR
Low Desert	8-11	HR	HR	HR	HR	S	HR	S	R	R	HR

FD=Fall Dormancy; SAA=Spotted Alfalfa Aphid; PA=Pea Aphid; BAA=Blue Alfalfa Aphid; PRR=Phytophthora Root Rot; BW=Bacterial Wilt; FW=Fusarium Wilt; VW=Verticillium Wilt; ANT=Anthracnose Race 1; STN=Stem Nematode; RKN= Southern Root Knot Nematode.

© D.H. Putnam

Pest Resistance:

Nematode damage

Spotted Alfalfa Aphid

Is resistance Absolute?

□ It's a numbers game.....

Alfalfa stem nematode damage

© D.H. Putnam

Variety Resistance

- It's often the **ONLY** cost-effective tool to combat many diseases, nematodes and insects
- Look at **Seed Quality (certification)**

© D.H. Putnam

Seed Quality: Inoculated, certified seed

- **Certified, high quality Seed (no dodder!)**
- **Insect, disease, nematode resistance**
- **Inoculated**

IV. Irrigation Management

- **Standing Water = enemy of alfalfa**
 - **Flood irrigation**
 - **Scald – death of seedling**
 - **Can damage stands with poor drainage**
 - **Helps to control gophers!**
 - **Drip irrigation**
 - **Reduces weed germination (benefit)**
 - **Bad for rodents/gophers**
 - **Sprinkler Irrigation**
 - **Also bad for gopher management**
- Leaf Diseases**
- Depth of irrigation? (encourage deep roots?)**

© D.H. Putnam

Tail-end Damage = Weed Intrusion

Stand Loss is the most common cause of
weed intrusion in mature stands
Combination of poor drainage, traffic, tail
design/levelling

© D.H. Putnam

Poor Irrigation Uniformity...

© D.H. Putnam

Results in Weed Intrusion:

© D.H. Putnam

Irrigation effects on rodents

- Key problem is with sprinklers and buried drip
Keep flooding in the equation (if possible)

V. Harvest Schedule

- ❑ First cutting after establishment – delay as long as possible
- ❑ Cutting early to mitigate insect populations and clipping for weeds
- ❑ ‘Staggered’ Cutting Schedule: Long cutting schedules with excellent irrigation can improve stand life and reduce weed intrusion

© D.H. Putnam

Harvest Management Impacts Weeds:

Maturity	Days	Weeds	Stand
Pre-Bud	21	48	29
Mid-Bud	25	54	38
10%Bloom	29	8	45
50%Bloom	33	0	56
100%Bloom	37	0	50

Recommend: Allow 'long' schedules at least 2x during year to improve roots and stand longevity, reduce weeds

V. Marble, 1974

© D.H. Putnam

Cutting Early to Mitigate Pest Damage

Yield and quality losses to summer hay (July, Aug cuttings)

But watch for windrow damage

VI. Cropping Systems

- **Crop Rotation**
- **No till**
- **Grazing**
- **Nurse crops**
- **Overseeding**
- **Traffic**
- **Equipment Sanitation**

© D.H. Putnam

Crop Rotation

- Highly Recommended
- Rotate with non-susceptible crops
 - **Nematodes, diseases**
- Weeds are adapted to annual vs. perennial systems
- Diseases build up over time – rotate with grains
- Opportunity for tillage, soil improvement

© D.H. Putnam

Residual Nitrogen – Following Corn vs. Alfalfa

Going into alfalfa (rotation):

- ❑ Grains/Non-legumes preferred before alfalfa (wheat, corn)
- ❑ Annuals (weed populations)
- ❑ Back-to-back alfalfa? (not recommended)
 - **But has been done – make sure you allow at least short break**
- ❑ Autotoxicity (suppression of seedling growth following alfalfa)
- ❑ Disease/nematode residues

© D.H. Putnam

No-Till Establishment

- ❑ Suited for pivots, rotations with grains
- ❑ Fit with check-flood?
 - **Fixing leveling and infiltration problems?**
- ❑ Prevents weed seeds coming to surface
- ❑ Creates other challenges for weeds, root oxygen (soil specific)
- ❑ Are soils adequately prepared?
- ❑ Soil aeration?

© D.H. Putnam

Companion Crops

- ❑ Especially for erodible land
- ❑ Oats/small grains/peas/berseem
- ❑ Low density
- ❑ Can contribute to a first cut yield
- ❑ Watch it! Aren't you really just planting a weed?? (oats can kill seedling alfalfa)
- ❑ Can lower vigor and density of alfalfa

Wheat nurse crop in alfalfa

© D.H. Putnam

Grazing to control weeds

- ❑ Must balance weed competition vs. damage by animals
- ❑ Moisture key issue-Soil compaction
- ❑ Grazing also reduces weevil infestation (eggs in stem)
- ❑ Timing/management is important

© D.H. Putnam

Grazing controlling Weeds

Clipping smothers

Grazing removes

Photo: Morgan Duran

© D.H. Putnam

Overseeding into Depleted Stands to Mitigate Weeds/weevil damage

'Overseed' – plant into existing older stands

- ❑ **Grasses or berseem clover**
- ❑ **Also mitigates weevil damage**
- ❑ **Fills in and prevents weed intrusion**
- ❑ **Extends life of stand**

Changes market

© D.H. Putnam

Traffic

- ❑ **Compacts Soils (root diseases)**
- ❑ **Reduces water infiltration**
- ❑ **Reduces vigor (weed competition)**
- ❑ **Reduces yield (20-30%)**
- ❑ **Causes Stand Loss (weed intrusion)**

© D.H. Putnam

Stem nematode

Equipment sanitation:

- Clean equipment between fields

© D.H. Putnam

WORLD ALFALFA
CONGRESS SAN DIEGO
CA | USA

Summary:

- There are a series of agronomic practices that have profound effects on pests
- Key areas are
 - **Stand Establishment Skill, timing, Soil Prep**
 - **Improving Soil Fertility for plant vigor**
 - **Variety Selection for pest resistance**
 - **Careful Irrigation Management**
 - **Harvest Management to improve persistence**
 - **Cropping Systems (Rotation)**

Integrated Crop Management' approach to pest management
